

# Phyton 27

## Bactericide/Fungicide for Ornamentals, Trees & Shrubs, Bedding Plants

Growers call Phyton 27 their “secret weapon” or “silver bullet” because it performs when other chemicals and controls fail. Phyton 27 is a broad-spectrum systemic that has been proven effective against many pathogens, including botrytis (gray mold), bacterial leaf spot, powdery mildew, and more. Its patented formula enables the active ingredient, copper sulfate pentahydrate, to be absorbed into the plant where it can move horizontally and up from the roots, killing pathogens that have attacked the internal system of the plant. With a residual of up to 21 days, it provides long-lasting protection, leaves no visible residue, and often enhances overall plant health and vitality.

- True systemic: readily absorbed and can move throughout the plant
- Preventive & curative for root and foliar diseases
- Use throughout the growing season, from propagation up to the time of harvest
- Low risk of phytotoxicity
- Rainfast/waterfast. Saves time and money on spray applications
- Highly effective at times of plant stressors, (i.e. during propagation, transplantation, transportation, and disease-inducing weather conditions)
- Compatible with most Integrated Pest Management (IPM) programs and biocontrols
- For use in the Greenhouse, Nursery, Field, Landscape, and Interiorscape
